SNAKE OUT[®]

Snake Repellent

NISUS TECHNICAL BULLETIN

Snake Out® Snake Repellent

Always read, understand and follow label completely before any applications.

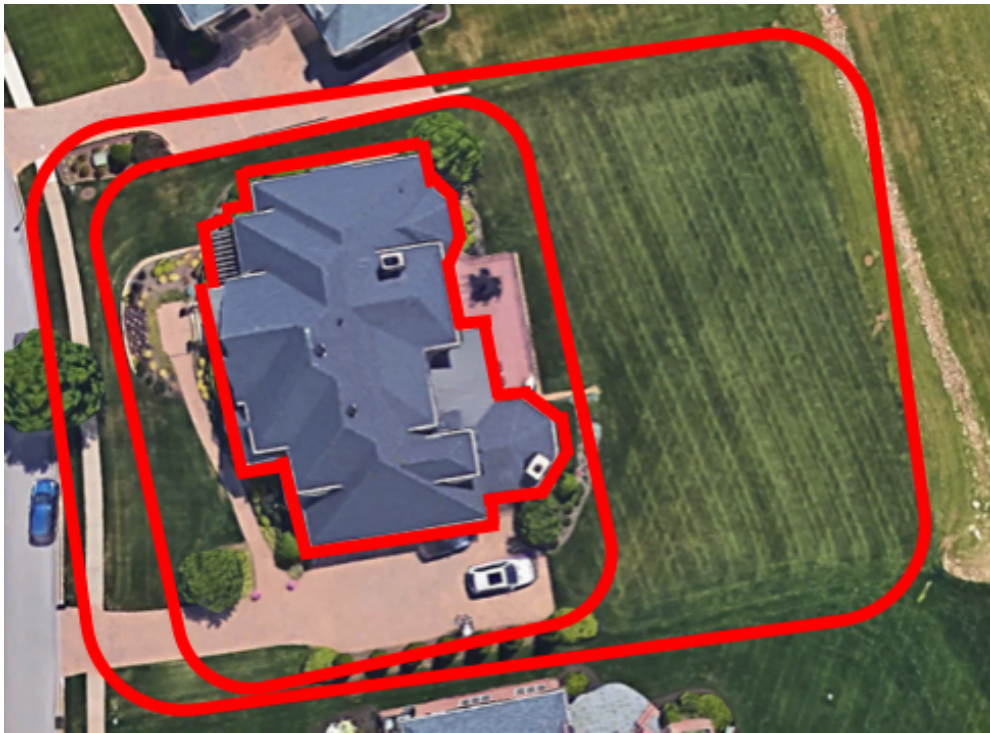

Introduction: Snakes are a limbless, elongated reptile that evolved from lizards. All snakes are carnivorous animals, and many species produce venom which helps to kill their prey. Being reptiles, they are cold-blooded animals, lay eggs and have scales. There are more than 3,500 species of snakes, and of these, approximately 600 are venomous. Regardless of species, all have highly sensitive receptor organs that can be aggravated to facilitate repellent behavior.

Snake Out Characteristics: Snake Out is a biodegradable spreadable snake repellent, and when used as directed, will not harm lawns, gardens, flowerbeds or other desirable plants. Snake Out creates a powerful taste/scent that snakes find unpleasant and triggers an avoidance behavior that makes snakes want to stay away from the area where it is applied.

Application Process: If possible, as snakes start to emerge from hibernation, start applying Snake Out around the

periphery of the residential or commercial structure in a 6" to 8" wide band. Wait several days and apply another band farther away from the structure to push snakes away even more. As snakes move away from the periphery, treatment focus is to continue creation of a repellent band to reinforce their aggravation and to facilitate their further movement away from the structure. Repeat this process as needed to reinforce increasing their distance from the desired area and to reinforce repellency. For the second band around decks, apply underneath decks where snakes like to hide. One pound will treat an area approximately 8" wide by 50' long. (Refer to application area image below.)

Environmental conditions will affect the residual potency of Snake Out. Snake Out will keep its potency in protected areas for several weeks; however, rain will eliminate the potency of Snake Out and the product must be reapplied.
